Person	Function description
Eric	Helped in the idea generation and outlined the implementation structure of the application. Deep Dive into Github and implemented an API with Spotipy (removed it after seeing we can't retrieve the features of the songs). Coded the random song selection algorithm. Selected the dataset and reduced the CSV files, so we could upload them to Github. Cleaning out some parts of the code(e.g dead code).
Alex	Helped in the idea generation and outlined the implementation structure of the application. Deep dive into machine learning and how the kNN algorithm functions and can be used for this purpose. Coded the technical part of the ML, especially the development of the final group vector. Converted the individual csv files into a dataset called app.db and set up the connection. Was part in the video filming.
Loris	Played a key role in creating the project idea. Organized and started meetings. Coded the rating part and adjusted the rest of the code to make it work. Helped with the idea for a good visualization. Was part of the video filming.
Bruno	Responsible for the User Interface (UI) and the visualization of data/rankings used
Lorenz	Mainly contributed to the idea generation and contributed to the machine learning part, especially the feature definition and scaling. Also supported in finding a fitting song dataset for the application. Developed, cut and finalised the demo video as well as the contribution matrix with the function description and helping tool listing.
